

# *Introduction to Computer Organization*

## *Welcome*

Amey Karkare

karkare@cse.iitk.ac.in

Department of CSE, IIT Kanpur

### ▶ Required Background

- ▶ Programming (Native Compilation techniques)
  - ▶ Pick up C/C++ if not known already.
- ▶ Knowledge of digital gates, flip-flops, latches, counters etc.
- ▶ Binary number system and operations

### ▶ What will be covered?

- ▶ Programming using Assembly Language
- ▶ Circuit descriptions in Bluespec Verilog (BSV)
- ▶ Computer Organization

## Course Structure

---

### ▶ Lectures:

- ▶ Wednesday, Thursday, Friday; 11:00 AM - 11:50 AM, L-5

### ▶ Labs:

- ▶ Groups of 2 students
- ▶ New language for design descriptions: BlueSpec Verilog (BSV)
- ▶ HW programming using FPGAs (Optional, if time and resources permit)
- ▶ Assembly language programming

## *Course Policies*

---

One midsem exam                      25 %

One endsem exam                    40 %

Labs                                      25 + 10 %

Tentative. May change as the course progresses.

*Course will be heavy*

- ▶ No text books
- ▶ Follow the lecture notes very closely
- ▶ Reference Books
  - ▶ BlueSpec Verilog:
    - ▶ Rishiyur S. Nikhil and Kathy Czeck: BSV by Example  
[[www.bluespec.com/forum/download.php?id=140](http://www.bluespec.com/forum/download.php?id=140)]
  - ▶ Assembly Language: Online notes
    - ▶ <http://asm.sourceforge.net/>
    - ▶ <http://chortle.ccsu.edu/AssemblyTutorial/index.html>
  - ▶ Computer Organization:
    - ▶ Patterson, Hannessy: Computer Organization and Design
    - ▶ Hamacher et.al.: Computer Organization
    - ▶ Tanenbaum: Structured Computer Organization
    - ▶ Parhami: Computer Architecture
    - ▶ Stallings: Computer Organization and Architecture

- ▶ I will form the groups of 2 students for assignments, and inform the class
- ▶ Give feed back through out the semester
  - ▶ Feel free to discuss anything with the instructor
  - ▶ including criticism of instructor, TAs
- ▶ Participate in the discussion
- ▶ No question is silly enough
  - ▶ Only Stupid Question = NO Question

- ▶ Keep checking the course web page for announcements.
- ▶ Do not be late for the class
- ▶ Keep your cell phones switched **off**
- ▶ I travel extensively. Be ready for substitute classes on the week-ends/holidays and/or in the evenings.
  - ▶ Extra class on **Saturday, January 4th, 11 AM.**

## DO NOT CHEAT

---

I follow **zero tolerance** policy.

- ▶ Straight **F** for copying in assignment
  - ▶ I do not distinguish between the *source* and the *destination* nodes of the *copy* edge.
- ▶ Names are also reported to authorities to be put in personal files.

**Any Questions/Comments/Suggestions?**

### ▶ Basic Gates

- ▶ AND, OR, NAND, NOR, XOR, XNOR, NOT, BUF

### ▶ Memory Elements

- ▶ Latch, Flip Flops
- ▶ Registers
  - ▶ Level Sensitive, Edge Triggered
  - ▶ Input output behaviour (Parallel or Serial): SISO (Delay Line), SIPO, PISO, PIPO
- ▶ Basic Circuits
  - ▶ Multiplexers, Counters, ALU, Adders, Multipliers

## Combinatorial Gates

---

```
always @(a or b)
    y = a & b;
```

OR

```
assign y = a & b;
```

### ▶ Latches

```
always @( LE or D )  
    if (LE == 1) Q = D;
```

### ▶ Flip Flops

```
always ( posedge CLK )  
    Q = D;
```

Latches are level sensitive while flip flops are edge triggered.

## A Computer

---

- ▶ Computer is a “machine”
- ▶ As long as power is supplied, processor keeps executing instructions
  - ▶ Stored program model
  - ▶ Sequential order of execution
- ▶ Memory: Program and data storage
- ▶ Disk: File storage (passive data storage)

## *The machine is electronic*

## *Fetch-Execute-Store Model*

---

- ▶ Processor reads an instruction from memory
- ▶ Instruction:
  - ▶ A sequence of bits, understood and operated upon by processor
- ▶ Processor interprets these bits and operates on data
  - ▶ Stored in internal registers or in memory
- ▶ Result of the execution is stored in memory/registers.
- ▶ Processor continues fetching the next instruction.
- ▶ Program:
  - ▶ Collection of instructions that are fetched and executed one after another

## Fetch-Execute-Store Model

---

- ▶ Processor takes program only as a sequence of bits
  - ▶ Machine Language
- ▶ We understand programs in various forms
  - ▶ Assembly language: One to one correspondence with the machine language
  - ▶ High level languages:
    - ▶ Translators are needed to convert to machine language (compilers)
  - ▶ Programs for Virtual machine:
    - ▶ Languages such as Java, compile code to a virtual machine which is then *interpreted* by a tool.
